Pillow Installation

For most users, the standard package manager `pip` is the way to go. Open your terminal or command prompt and run:

```
pip install Pillow
```

BASH

Sometimes the `pip` command doesn't work. Use this specific command if the one above fails:

```
python -m pip install Pillow
```

BASH

If the standard commands fail, try using `pip3` or `python3`. Some environments, particularly on macOS and Linux, use the `3` suffix to distinguish the modern interpreter from legacy system versions and prevent version conflicts.

Run the following command at the terminal to verify that Pillow was successfully installed:

```
python -c "import PIL; print('Pillow installed successfully')"
```

BASH

If everything is OK, you should see the message `Pillow installed successfully` printed in your terminal.
